

Appendix I

Conversion of units

From Wikipedia, the free encyclopedia

Conversion of units refers to **conversion factors** between different units of measurement for the same quantity.

Techniques

Process

The process of conversion depends on the specific situation and the intended purpose. This may be governed by regulation, contract, Technical specifications or other published standards. Engineering judgment may include such factors as:

- The precision and accuracy of measurement and the associated uncertainty of measurement
- The statistical confidence interval or tolerance interval of the initial measurement
- The number of significant figures of the measurement
- The intended use of the measurement including the engineering tolerances

Some conversions from one system of units to another need to be exact, without increasing or decreasing the precision of the first measurement. This is sometimes called *soft conversion*. It does not involve changing the physical configuration of the item being measured.

By contrast, a *hard conversion* or an *adaptive conversion* may not be exactly equivalent. It changes the measurement to convenient and workable numbers and units in the new system. It sometimes involves a slightly different configuration, or size substitution, of the item.

Multiplication Factors

Conversion between units in the metric (SI) system can be discerned by their prefixes (for example, 1 kilogram = 1000 grams, 1 milligram = 0.001 grams) and are thus not listed in this article. Exceptions are made if the unit is commonly known by another name (for example, 1 micron = 10^{-6} metre). For a full listing of multiplication factors, see SI prefix.

Table Ordering

Within each table, the units are listed alphabetically, and the SI units (base or derived) are highlighted.

Tables of conversion factors

This article gives lists of conversion factors for each of a number of physical quantities, which are listed in the index. For each physical quantity, a number of different units (some only of historical interest) are shown and expressed in terms of the corresponding SI unit.

Legend

Symbol	Definition
\equiv	exactly equal to
\approx	approximately equal to
<i>digits</i>	indicates that <i>digits</i> repeat infinitely (e.g. 8.294 369 corresponds to 8.294 369 369 369 369...)
(H)	of chiefly historical interest

Length

Length			
Name of unit	Symbol	Definition	Relation to SI units
ångström	Å	$\equiv 1 \times 10^{-10} \text{ m}$	$\equiv 0.1 \text{ nm}$
astronomical unit	AU	\approx Distance from Earth to Sun	$\approx 149\,597\,871\,464 \text{ m}$ ^[1]
barleycorn (H)		$= \frac{1}{3} \text{ in}$ (see note above about rounding)	$\approx 8.46 \times 10^{-3} \text{ m}$
bohr, atomic unit of length	a_0	\equiv Bohr radius of hydrogen	$\approx 5.291\,772\,0859 \times 10^{-11} \pm 3.6 \times 10^{-20} \text{ m}$ ^[2]
cable length (Imperial)		$\equiv 608 \text{ ft}$	$\approx 185.3184 \text{ m}$
cable length (International)		$\equiv 1/10 \text{ nmi}$	$\equiv 185.2 \text{ m}$
cable length (U.S.)		$\equiv 720 \text{ ft}$	$= 219.456 \text{ m}$
chain (Gunter's; Surveyor's)	ch	$\equiv 66 \text{ ft(US)} \equiv 4 \text{ rods}$ ^[3]	$\approx 20.116\,84 \text{ m}$
cubit (H)		\equiv Distance from fingers to elbow $\approx 18 \text{ in}$	$\approx 0.5 \text{ m}$
ell (H)	ell	$\equiv 45 \text{ in}$ ^[4] (In England usually)	$= 1.143 \text{ m}$
fathom	fm	$\equiv 6 \text{ ft}$ ^[4]	$= 1.8288 \text{ m}$
fermi	fm	$\equiv 1 \times 10^{-15} \text{ m}$ ^[4]	$\equiv 1 \times 10^{-15} \text{ m}$
finger		$\equiv 7/8 \text{ in}$	$= 0.022\,225 \text{ m}$
finger (cloth)		$\equiv 4\frac{1}{2} \text{ in}$	$= 0.1143 \text{ m}$
foot (Benoît) (H)	ft (Ben)		$\approx 0.304\,799\,735 \text{ m}$
foot (Clarke's; Cape) (H)	ft (Cla)		$\approx 0.304\,797\,2654 \text{ m}$
foot (Indian) (H)	ft Ind		$\approx 0.304\,799\,514 \text{ m}$
foot (International)	ft	$\equiv 1/3 \text{ yd} \equiv 0.3048 \text{ m} \equiv 12 \text{ inches}$	$\equiv 0.3048 \text{ m}$

foot (Sear's) (H)	ft (Sear)		$\approx 0.304\,799\,47\text{ m}$
foot (U.S. Survey)	ft (US)	$\equiv 1200/3937\text{ m}^{[5]}$	$\approx 0.304\,800\,610\text{ m}$
french; charriere	F	$\equiv \frac{1}{3}\text{ mm}$	$= 3.3 \times 10^{-4}\text{ m}$
furlong	fur	$\equiv 10\text{ chains} = 660\text{ ft} = 220\text{ yd}^{[4]}$	$= 201.168\text{ m}$
hand		$\equiv 4\text{ in}^{[4]}$	$\equiv 0.1016\text{ m}$
inch (International)	in	$\equiv 1/36\text{ yd} \equiv 1/12\text{ ft}$	$\equiv 0.0254\text{ m}$
league (land)	lea	$\equiv 3\text{ US Statute miles}^{[3]}$	$= 4\,828.032\text{ m}$
light-day		$\equiv 24\text{ light-hours}$	$\equiv 2.590\,206\,837\,12 \times 10^{13}\text{ m}$
light-hour		$\equiv 60\text{ light-minutes}$	$\equiv 1.079\,252\,8488 \times 10^{12}\text{ m}$
light-minute		$\equiv 60\text{ light-seconds}$	$\equiv 1.798\,754\,748 \times 10^{10}\text{ m}$
light-second		$\equiv \text{Distance light travels in one second in vacuum}$	$\equiv 299\,792\,458\text{ m}$
light-year	l.y.	$\equiv \text{Distance light travels in vacuum in } 365.25\text{ days}^{[6]}$	$= 9.460\,730\,472\,5808 \times 10^{15}\text{ m}$
line	ln	$\equiv 1/12\text{ in}^{[7]}$	$= 0.002\,116\text{ m}$
link (Gunter's; Surveyor's)	lnk	$\equiv 1/100\text{ ch}^{[4]} \equiv 0.66\text{ ft} \equiv 7.92\text{ in}$	$= 0.201\,168\text{ m}$
link (Ramsden's; Engineer's)	lnk	$\equiv 1\text{ ft}^{[4]}$	$= 0.3048\text{ m}$
metre (SI base unit)	m	$\equiv \text{Distance light travels in } 1/299\,792\,458\text{ of a second in vacuum.}^{[8]} \approx \text{distance from equator to pole}/10\,000\,000$	$\equiv 1\text{ m}$
mickey		$\equiv 1/200\text{ in}$	$= 1.27 \times 10^{-4}\text{ m}$
micron	μ		$\equiv 1 \times 10^{-6}\text{ m}$
mil; thou	mil	$\equiv 1 \times 10^{-3}\text{ in}$	$\equiv 2.54 \times 10^{-5}\text{ m}$
mil (Sweden and Norway)	mil	$\equiv 10\text{ km}$	$= 10\,000\text{ m}$
mile (geographical) (H)		$\equiv 6082\text{ ft}$	$= 1\,853.7936\text{ m}$
mile (international)	mi	$\equiv 80\text{ chains} \equiv 5280\text{ ft} \equiv 1760\text{ yd}$	$\equiv 1\,609.344\text{ m}$
mile (tactical or data)		$\equiv 6000\text{ ft}$	$\equiv 1828.8\text{ m}$
mile (telegraph) (H)	mi	$\equiv 6087\text{ ft}$	$= 1\,855.3176\text{ m}$

mile (U.S. Survey)	mi	$\equiv 5280 \text{ ft (US Survey feet)} \equiv (5280 \times 1200/3937) \text{ m}$	$\approx 1\,609.347\,219 \text{ m}$
nail (cloth)		$\equiv 2\frac{1}{4} \text{ in}^{[4]}$	$= 0.057\,15 \text{ m}$
nautical league	NL; nl	$\equiv 3 \text{ nmi}^{[4]}$	$= 5556 \text{ m}$
nautical mile (Admiralty)	NM (Adm); nmi (Adm)	$= 6080 \text{ ft}$	$= 1853.184 \text{ m}$
nautical mile (international)	NM; nmi	$\equiv 1852 \text{ m}^{[9]}$	$\equiv 1852 \text{ m}$
nautical mile (US pre 1954)		$\equiv 1853.248 \text{ m}$	$\equiv 1853.248 \text{ m}$
pace		$\equiv 2.5 \text{ ft}^{[4]}$	$= 0.762 \text{ m}$
palm		$\equiv 3 \text{ in}^{[4]}$	$= 0.0762 \text{ m}$
parsec	pc	Distance of star with <i>parallax</i> shift of one arc <i>second</i> from a base of one astronomical unit	$\approx 3.085\,677\,82 \times 10^{16} \pm 6 \times 10^6 \text{ m}^{[10]}$
pica		$\equiv 12 \text{ points}$	Dependent on point measures.
point (American, English) ^{[11][12]}	pt	$\equiv 1/72.272 \text{ in}$	$\approx 0.000\,351\,450 \text{ m}$
point (Didot; European) ^{[12][13]}	pt	$\equiv 1/12 \times 1/72$ of pied du roi; After 1878: $\equiv 5/133 \text{ cm}$	$\approx 0.000\,375\,97 \text{ m};$ After 1878: $\approx 0.000\,375\,939\,85 \text{ m}$
point (PostScript) ^[11]	pt	$\equiv 1/72 \text{ in}$	$= 0.000\,352\,7 \text{ m}$
point (TeX) ^[11]	pt	$\equiv 1/72.27 \text{ in}$	$= 0.000\,351\,4598 \text{ m}$
quarter		$\equiv \frac{1}{4} \text{ yd}$	$= 0.2286 \text{ m}$
rod; pole; perch (H)	rd	$\equiv 16\frac{1}{2} \text{ ft}$	$= 5.0292 \text{ m}$
rope (H)	rope	$\equiv 20 \text{ ft}^{[4]}$	$= 6.096 \text{ m}$
span (H)		$\equiv 9 \text{ in}^{[4]}$	$= 0.2286 \text{ m}$
spat ^[14]			$\equiv 1 \times 10^{12} \text{ m}$
stick (H)		$\equiv 2 \text{ in}$	$= 0.0508 \text{ m}$
stigma; bicron (picometre)	pm		$\equiv 1 \times 10^{-12} \text{ m}$
twip	twp	$\equiv 1/1440 \text{ in}$	$= 1.7638 \times 10^{-5} \text{ m}$
x unit; siegbahn	xu		$\approx 1.0021 \times 10^{-13} \text{ m}^{[4]}$
yard			

(International)	yd	$\equiv 0.9144 \text{ m}^{[5]} \equiv 3 \text{ ft} \equiv 36 \text{ in}$	$\equiv 0.9144 \text{ m}$

Plane angle

Plane angle			
Name of unit	Symbol	Definition	Relation to SI units
angular mil	μ	$\equiv 2\pi/6400$ rad	$\approx 0.981\,748 \times 10^{-3}$ rad
arcminute	'	$\equiv 1^\circ/60$	$\approx 0.290\,888 \times 10^{-3}$ rad
arcsecond	"	$\equiv 1^\circ/3600$	$\approx 4.848\,137 \times 10^{-6}$ rad
centesimal minute of arc	'	$\equiv 1$ grad/100	$\approx 0.157\,080 \times 10^{-3}$ rad
centesimal second of arc	"	$\equiv 1$ grad/(10 000)	$\approx 1.570\,796 \times 10^{-6}$ rad
degree (of arc)	$^\circ$	$\equiv 1/360$ of a revolution $\equiv \pi/180$ rad	$\approx 17.453\,293 \times 10^{-3}$ rad
grad; gradian; gon	grad	$\equiv 1/400$ of a revolution $\equiv 2\pi/400$ rad $\equiv 0.9^\circ$	$\approx 15.707\,963 \times 10^{-3}$ rad
octant		$\equiv 45^\circ$	$\approx 0.785\,398$ rad
quadrant		$\equiv 90^\circ$	$\approx 1.570\,796$ rad
radian (SI unit)	rad	The angle subtended at the center of a circle by an arc whose length is equal to the circle's radius. One full revolution encompasses 2π radians.	$= 1$ rad
sextant		$\equiv 60^\circ$	$\approx 1.047\,198$ rad
sign		$\equiv 30^\circ$	$\approx 0.523\,599$ rad

Solid angle

Solid angle			
Name of unit	Symbol	Definition	Relation to SI units
steradian (SI unit)	sr	The solid angle subtended at the center of a sphere of radius r by a portion of the surface of the sphere having an area r^2 . A sphere encompasses 4π sr. ^[14]	$= 1$ sr

Mass

Notes:

- See Weight for detail of mass/weight distinction and conversion.
- In this table, the unit *gee* is used to denote standard gravity in order to avoid confusion with the "g" symbol for grams.

- In physics, the pound of mass is sometimes written **lbm** to distinguish it from the pound-force (**lbf**). It should not be read as the mongrel unit "pound metre".

Mass			
Name of unit	Symbol	Definition	Relation to SI units
atomic mass unit, unified	u; AMU		$\approx 1.660\,538\,73 \times 10^{-27} \pm 1.3 \times 10^{-36} \text{ kg}$
atomic unit of mass, electron rest mass	m_e		$\approx 9.109\,382\,15 \times 10^{-31} \pm 45 \times 10^{-39} \text{ kg}$ ^[18]
bag (coffee)		$\equiv 60 \text{ kg}$	$= 60 \text{ kg}$
bag (Portland cement)		$\equiv 94 \text{ lb av}$	$= 42.637\,682\,78 \text{ kg}$
barge		$\equiv 22\frac{1}{2} \text{ sh tn}$	$= 20\,411.656\,65 \text{ kg}$
carat	kt	$\equiv 3\frac{1}{6} \text{ gr}$	$\approx 205.196\,548\,333 \text{ mg}$
carat (metric)	ct	$\equiv 200 \text{ mg}$	$= 200 \text{ mg}$
clove		$\equiv 8 \text{ lb av}$	$= 3.628\,738\,96 \text{ kg}$
crith			$\approx 89.9349 \text{ mg}$
dalton	Da		$\approx 1.660\,902\,10 \times 10^{-27} \pm 1.3 \times 10^{-36} \text{ kg}$
dram (apothecary; troy)	dr t	$\equiv 60 \text{ gr}$	$= 3.887\,9346 \text{ g}$
dram (avoirdupois)	dr av	$\equiv 27\frac{11}{32} \text{ gr}$	$= 1.771\,845\,195\,3125 \text{ g}$
electronvolt	eV	$\equiv 1 \text{ eV (energy unit)} / c^2$	$= 1.7826 \times 10^{-36} \text{ kg}$
gamma	γ	$\equiv 1 \mu\text{g}$	$= 1 \mu\text{g}$
grain	gr	$\equiv 1/7000 \text{ lb av}$	$\equiv 64.798\,91 \text{ mg}$
grave	G	grave was the original name of the kilogram	$\equiv 1 \text{ kg}$
hundredweight (long)	long cwt or cwt	$\equiv 112 \text{ lb av}$	$= 50.802\,345\,44 \text{ kg}$
hundredweight (short); cental	sh cwt	$\equiv 100 \text{ lb av}$	$= 45.359\,237 \text{ kg}$
hyl (CGS unit)		$\equiv 1 \text{ gee} \times 1 \text{ g} \times 1 \text{ s}^2/\text{m}$	$= 9.806\,65 \text{ g}$
hyl (MKS unit)		$\equiv 1 \text{ gee} \times 1 \text{ kg} \times 1 \text{ s}^2/\text{m}$	$= 9.806\,65 \text{ kg}$
kilogram	kg	\equiv mass of the prototype near Paris (\approx mass of 1L of water)	$\equiv 1 \text{ kg (SI base unit)}$ ^[8]
kip	kip	$\equiv 1000 \text{ lb av}$	$= 453.592\,37 \text{ kg}$
mark		$\equiv 8 \text{ oz t}$	$= 248.827\,8144 \text{ g}$
mite		$\equiv 1/20 \text{ gr}$	$= 3.239\,9455 \text{ mg}$
mite (metric)		$\equiv 1/20 \text{ g}$	$= 50 \text{ mg}$
ounce (apothecary; troy)	oz t	$\equiv 1/12 \text{ lb t}$	$= 31.103\,4768 \text{ g}$

ounce (avoirdupois)	oz av	$\equiv 1/16$ lb	$= 28.349\,523\,125$ g
ounce (U.S. food nutrition labeling)	oz	$\equiv 28$ g ^[16]	$= 28$ g
pennyweight	dwt; pwt	$\equiv 1/20$ oz t	$= 1.555\,173\,84$ g
point		$\equiv 1/100$ ct	$= 2$ mg
pound (avoirdupois)	lb av	$\equiv 0.453\,592\,37$ kg = 7000 grains	$\equiv 0.453\,592\,37$ kg
pound (metric)		$\equiv 500$ g	$= 500$ g
pound (troy)	lb t	$\equiv 5\,760$ grains	$= 0.373\,241\,7216$ kg
quarter (Imperial)		$\equiv 1/4$ long cwt = 2 st = 28 lb av	$= 12.700\,586\,36$ kg
quarter (informal)		$\equiv 1/4$ short tn	$= 226.796\,185$ kg
quarter, long (informal)		$\equiv 1/4$ long tn	$= 254.011\,7272$ kg
quintal (metric)	q	$\equiv 100$ kg	$= 100$ kg
scruple (apothecary)	s ap	$\equiv 20$ gr	$= 1.295\,9782$ g
sheet		$\equiv 1/700$ lb av	$= 647.9891$ mg
slug; geepound	slug	$\equiv 1$ gee $\times 1$ lb av $\times 1$ s ² /ft	$\approx 14.593\,903$ kg
stone	st	$\equiv 14$ lb av	$= 6.350\,293\,18$ kg
ton, assay (long)	AT	$\equiv 1$ mg $\times 1$ long tn $\div 1$ oz t	$\approx 32.666\,667$ g
ton, assay (short)	AT	$\equiv 1$ mg $\times 1$ sh tn $\div 1$ oz t	$\approx 29.166\,667$ g
ton, long	long tn or ton	$\equiv 2\,240$ lb	$= 1\,016.046\,9088$ kg
ton, short	sh tn	$\equiv 2\,000$ lb	$= 907.184\,74$ kg
tonne (mts unit)	t	$\equiv 1\,000$ kg	$= 1\,000$ kg
wey		$\equiv 252$ lb = 18 st	$= 114.305\,277\,24$ kg (variants exist)
Zentner	Ztr.	Definitions vary; see ^[19] and ^[14]	

Density

Density			
Name of unit	Symbol	Definition	Relation to SI units
gram per millilitre	g/mL	\equiv g/mL	$= 1,000$ kg/m ³
kilogram per cubic metre (SI unit)	kg/m ³	\equiv kg/m ³	$= 1$ kg/m ³
kilogram per litre	kg/L	\equiv kg/L	$= 1,000$ kg/m ³
ounce (avoirdupois) per cubic foot	oz/ft ³	\equiv oz/ft ³	$\approx 1.001\,153\,961$ kg/m ³
ounce (avoirdupois) per cubic inch	oz/in ³	\equiv oz/in ³	$\approx 1.729\,994\,044 \times 10^3$ kg/m ³

ounce (avoirdupois) per gallon (Imperial)	oz/gal	\equiv oz/gal	$\approx 6.236\,023\,291\text{ kg/m}^3$
ounce (avoirdupois) per gallon (U.S. fluid)	oz/gal	\equiv oz/gal	$\approx 7.489\,151\,707\text{ kg/m}^3$
pound (avoirdupois) per cubic foot	lb/ft ³	\equiv lb/ft ³	$\approx 16.018\,463\,37\text{ kg/m}^3$
pound (avoirdupois) per cubic inch	lb/in ³	\equiv lb/in ³	$\approx 2.767\,990\,471 \times 10^4\text{ kg/m}^3$
pound (avoirdupois) per gallon (Imperial)	lb/gal	\equiv lb/gal	$\approx 99.776\,372\,66\text{ kg/m}^3$
pound (avoirdupois) per gallon (U.S. fluid)	lb/gal	\equiv lb/gal	$\approx 119.826\,4273\text{ kg/m}^3$
slug per cubic foot	slug/ft ³	\equiv slug/ft ³	$\approx 515.378\,8184\text{ kg/m}^3$

Time

Time, t			
Name of unit	Symbol	Definition	Relation to SI units
atomic unit of time	au	$\equiv a_0/(\alpha \cdot c)$	$\approx 2.418\,884\,254 \times 10^{-17}\text{ s}$
Callippic cycle		$\equiv 441\text{ mo (hollow)} + 499\text{ mo (full)} = 76\text{ a of }365.25\text{ d}$	$= 2.398\,3776 \times 10^9\text{ s}$
century	c	$\equiv 100\text{ a (see below for definition of year length)}$	$= 100 \times \text{year}$
day	d	$= 24\text{ h}$	$= 86\,400\text{ s}$
day (sidereal)	d	\equiv Time needed for the Earth to rotate once around its axis, determined from successive transits of a very distant astronomical object across an observer's meridian (International Celestial Reference Frame)	$\approx 86\,164.1\text{ s}$
decade	dec	$\equiv 10\text{ a (see below for definition of year length)}$	$= 10 \times \text{year}$
fortnight	fn	$\equiv 2\text{ wk}$	$= 1\,209\,600\text{ s}$
helek		$\equiv 1/1\,080\text{ h}$	$= 3.3\text{ s}$
Hipparchic cycle		$\equiv 4\text{ Callippic cycles} - 1\text{ d}$	$= 9.593\,424 \times 10^9\text{ s}$
hour	h	$\equiv 60\text{ min}$	$= 3\,600\text{ s}$
jiffy	j	$\equiv 1/60\text{ s}$	$= .016\text{ s}$
jiffy (alternate)	ja	$\equiv 1/100\text{ s}$	$= 10\text{ ms}$
ke (quarter of an hour)		$\equiv \frac{1}{4}\text{ h} = 1/96\text{ d}$	$= 60 \times 60 / 4\text{ s} = 900\text{ s} = 60 / 4\text{ min} = 15\text{ min}$
ke (traditional)		$\equiv 1/100\text{ d}$	$= 24 \times 60 \times 60 / 100\text{ s} = 864\text{ s} = 24 * 60 / 100\text{ min} = 14.4\text{ min}$
lustre; lustrum		$\equiv 5\text{ a of }365\text{ d}$	$= 1.5768 \times 10^8\text{ s}$

Metonic cycle; enneadecaeteris		$\equiv 110 \text{ mo (hollow)} + 125 \text{ mo (full)} = 6940 \text{ d} \approx 19 \text{ a}$	$= 5.996\,16 \times 10^8 \text{ s}$
millennium		$\equiv 1\,000 \text{ a (see below for definition of year length)}$	$= 1000 \times \text{year}$
milliday	md	$\equiv 1/1\,000 \text{ d}$	$= 24 \times 60 \times 60 / 1\,000 \text{ s} = 86.4 \text{ s}$
minute	min	$\equiv 60 \text{ s, due to leap seconds sometimes } 59 \text{ s or } 61 \text{ s,}$	$= 60 \text{ s}$
moment		$\equiv 90 \text{ s}$	$= 90 \text{ s}$
month (full)	mo	$\equiv 30 \text{ d}^{[20]}$	$= 2\,592\,000 \text{ s}$
month (Greg. av.)	mo	Average Gregorian month = $365.2425/12 \text{ d} = 30.436875 \text{ d}$	$\approx 2.6297 \times 10^6 \text{ s}$
month (hollow)	mo	$\equiv 29 \text{ d}^{[20]}$	$= 2\,505\,600 \text{ s}$
month (synodic)	mo	Cycle time of moon phases $\approx 29.530589 \text{ days (Average)}$	$\approx 2.551 \times 10^6 \text{ s}$
octaeteris		$= 48 \text{ mo (full)} + 48 \text{ mo (hollow)} + 3 \text{ mo (full)}^{[21][22]} = 8 \text{ a of } 365.25 \text{ d} = 2922 \text{ d}$	$= 2.524\,608 \times 10^8 \text{ s}$
Planck time		$\equiv (G\hbar/c^5)^{1/2}$	$\approx 1.351\,211\,868 \times 10^{-43} \text{ s}$
second	s	time of $9\,192\,631\,770$ periods of the radiation corresponding to the transition between the 2 hyperfine levels of the ground state of the caesium 133 atom at $0 \text{ K}^{[8]}$ (but other seconds are sometimes used in astronomy)	(SI base unit)
shake		$\equiv 10^{-8} \text{ s}$	$= 10 \text{ ns}$
sigma		$\equiv 10^{-6} \text{ s}$	$= 1 \mu\text{s}$
Sothic cycle		$\equiv 1\,461 \text{ a of } 365 \text{ d}$	$= 4.607\,4096 \times 10^{10} \text{ s}$
svedberg	S	$\equiv 10^{-13} \text{ s}$	$= 100 \text{ fs}$
week	wk	$\equiv 7 \text{ d}$	$= 604\,800 \text{ s}$
year (Gregorian)	a, y, or yr	$= 365.2425 \text{ d average, calculated from common years (365 d) plus leap years (366 d) on most years divisible by 4. See leap year for details.}$	$= 31\,556\,952 \text{ s}$
year (Julian)	a, y, or yr	$= 365.25 \text{ d average, calculated from common years (365 d) plus one leap year (366 d) every four years}$	$= 31\,557\,600 \text{ s}$
year (sidereal)	a, y, or yr	$\equiv \text{time taken for Sun to return to the same position with respect to the stars of the celestial sphere}$	$\approx 365.256\,363 \text{ d} \approx 31\,558\,149.7632 \text{ s}$
		$\equiv \text{Length of time it takes for the Sun to}$	

year (tropical)	a, y, <i>or</i> yr	return to the same position in the cycle of seasons	$\approx 365.242\,190\text{ d} \approx 31\,556\,925\text{ s}$
-----------------	--------------------	---	---

Where UTC is observed, the length of time units longer than 1 s may increase or decrease by 1 s if a leap second occurs during the time interval of interest.

Frequency

Frequency			
Name of unit	Symbol	Definition	Relation to SI units
hertz (SI unit)	Hz	\equiv Number of cycles per second	$= 1\text{ Hz} = 1/\text{s}$
revolutions per minute	rpm	\equiv One unit rpm equals one rotation completed around a fixed axis in one minute of time.	$\approx 0.104\,719\,755\text{ rad/s}$

Speed or velocity

distance/time
Speed

Name of unit	Symbol	Definition	Relation to SI units
foot per hour	fph	$\equiv 1\text{ ft/h}$	$\approx 8.466\,667 \times 10^{-5}\text{ m/s}$
foot per minute	fpm	$\equiv 1\text{ ft/min}$	$= 5.08 \times 10^{-3}\text{ m/s}$
foot per second	fps	$\equiv 1\text{ ft/s}$	$= 3.048 \times 10^{-1}\text{ m/s}$
furlong per fortnight		\equiv furlong/fortnight	$\approx 1.663\,095 \times 10^{-4}\text{ m/s}$
inch per minute	ipm	$\equiv 1\text{ in/min}$	$\approx 4.23\,333 \times 10^{-4}\text{ m/s}$
inch per second	ips	$\equiv 1\text{ in/s}$	$= 2.54 \times 10^{-2}\text{ m/s}$
kilometre per hour	km/h	$\equiv 1\text{ km/h}$	$\approx 2.777\,778 \times 10^{-1}\text{ m/s}$
knot	kn	$\equiv 1\text{ NM/h} = 1.852\text{ km/h}$	$\approx 0.514\,444\text{ m/s}$
knot (Admiralty)	kn	$\equiv 1\text{ NM (Adm)/h} = 1.853\,184\text{ km/h}$ ^[citation needed]	$= 0.514\,773\text{ m/s}$
mach number	<i>M</i>	Ratio of the speed to the speed of sound in the medium. Varies especially with temperature. About 761 mph (1225 kph) in air at sea level to about 660 mph (1062 kph) at jet altitudes. Unitless	$\approx 340\text{ to }295\text{ m/s}$ for aircraft
metre per second (SI unit)	m/s	$\equiv 1\text{ m/s}$	$= 1\text{ m/s}$

mile per hour	mph	$\equiv 1 \text{ mi/h}$	$= 0.447\,04 \text{ m/s}$
mile per minute	mpm	$\equiv 1 \text{ mi/min}$	$= 26.8224 \text{ m/s}$
mile per second	mps	$\equiv 1 \text{ mi/s}$	$= 1\,609.344 \text{ m/s}$
speed of light in vacuum	c	$\equiv 299\,792\,458 \text{ m/s}$	$= 299\,792\,458 \text{ m/s}$
speed of sound in air	s	Varies especially with temperature. About 761 mph (1225 kph) in air at sea level to about 660 mph (1062 kph) at jet altitudes.	$\approx 340 \text{ to } 295 \text{ m/s}$ at aircraft altitudes

A velocity consists of a speed combined with a direction; the speed part of the velocity takes units of speed.

Flow (volume)

Flow			
Name of unit	Symbol	Definition	Relation to SI units
cubic foot per minute	CFM	$\equiv 1 \text{ ft}^3/\text{min}$	$= 4.719\,474\,432 \times 10^{-4} \text{ m}^3/\text{s}$
cubic foot per second	ft^3/s	$\equiv 1 \text{ ft}^3/\text{s}$	$= 0.028\,316\,846\,592 \text{ m}^3/\text{s}$
cubic inch per minute	in^3/min	$\equiv 1 \text{ in}^3/\text{min}$	$= 2.731\,1773 \times 10^{-7} \text{ m}^3/\text{s}$
cubic inch per second	in^3/s	$\equiv 1 \text{ in}^3/\text{s}$	$= 1.638\,7064 \times 10^{-5} \text{ m}^3/\text{s}$
cubic metre per second (SI unit)	m^3/s	$\equiv 1 \text{ m}^3/\text{s}$	$= 1 \text{ m}^3/\text{s}$
gallon (U.S. fluid) per day	GPD	$\equiv 1 \text{ gal/d}$	$= 4.381\,263\,638 \times 10^{-8} \text{ m}^3/\text{s}$
gallon (U.S. fluid) per hour	GPH	$\equiv 1 \text{ gal/h}$	$= 1.051\,503\,273 \times 10^{-6} \text{ m}^3/\text{s}$
gallon (U.S. fluid) per minute	GPM	$\equiv 1 \text{ gal/min}$	$= 6.309\,019\,64 \times 10^{-5} \text{ m}^3/\text{s}$
litre per minute	LPM	$\equiv 1 \text{ L/min}$	$= 1.6 \times 10^{-5} \text{ m}^3/\text{s}$

Acceleration

Acceleration			
Name of unit	Symbol	Definition	Relation to SI units
foot per hour per second	fph/s	$\equiv 1 \text{ ft}/(\text{h}\cdot\text{s})$	$\approx 8.466\,667 \times 10^{-5} \text{ m/s}^2$
foot per minute per second	fpm/s	$\equiv 1 \text{ ft}/(\text{min}\cdot\text{s})$	$= 5.08 \times 10^{-3} \text{ m/s}^2$
foot per second squared	fps^2	$\equiv 1 \text{ ft/s}^2$	$= 3.048 \times 10^{-1} \text{ m/s}^2$
gal; galileo	Gal	$\equiv 1 \text{ cm/s}^2$	$= 10^{-2} \text{ m/s}^2$
inch per minute per second	ipm/s	$\equiv 1 \text{ in}/(\text{min}\cdot\text{s})$	$\approx 4.233\,333 \times 10^{-4} \text{ m/s}^2$
inch per second squared	ips^2	$\equiv 1 \text{ in/s}^2$	$= 2.54 \times 10^{-2} \text{ m/s}^2$

knot per second	kn/s	$\equiv 1 \text{ kn/s}$	$\approx 5.144\,444 \times 10^{-1} \text{ m/s}^2$
metre per second squared (SI unit)	m/s^2	$\equiv 1 \text{ m/s}^2$	$= 1 \text{ m/s}^2$
mile per hour per second	mph/s	$\equiv 1 \text{ mi}/(\text{h}\cdot\text{s})$	$= 4.4704 \times 10^{-1} \text{ m/s}^2$
mile per minute per second	mpm/s	$\equiv 1 \text{ mi}/(\text{min}\cdot\text{s})$	$= 26.8224 \text{ m/s}^2$
mile per second squared	mps^2	$\equiv 1 \text{ mi/s}^2$	$= 1.609\,344 \times 10^3 \text{ m/s}^2$
standard gravity	<i>g</i>	$\equiv 9.806\,65 \text{ m/s}^2$	$= 9.806\,65 \text{ m/s}^2$

Force

Force			
Name of unit	Symbol	Definition	Relation to SI units
atomic unit of force		$\equiv m_e \cdot \alpha^2 \cdot c^2 / a_0$	$\approx 8.238\,722\,06 \times 10^{-8} \text{ N}$ [23]
dyne (cgs unit)	dyn	$\equiv g \cdot \text{cm/s}^2$	$= 10^{-5} \text{ N}$
kilogram-force; kilopond; grave-force	kgf; kp; Gf	$\equiv g \times 1 \text{ kg}$	$= 9.806\,65 \text{ N}$
kip; kip-force	kip; kipf; klbf	$\equiv g \times 1\,000 \text{ lb}$	$=$ $4.448\,221\,615\,2605 \times 10^3 \text{ N}$
milligrave-force, gravet-force	mGf; gf	$\equiv g \times 1 \text{ g}$	$= 9.806\,65 \text{ mN}$
newton (SI unit)	N	A force capable of giving a mass of one kg an acceleration of one metre per second, per second. ^[24]	$= 1 \text{ N} = 1 \text{ kg}\cdot\text{m/s}^2$
ounce-force	ozf	$\equiv g \times 1 \text{ oz}$	$= 0.278\,013\,850\,953\,7812 \text{ N}$
pound	lb	$\equiv \text{slug}\cdot\text{ft/s}^2$	$= 4.448\,230\,531 \text{ N}$
pound-force	lbf	$\equiv g \times 1 \text{ lb}$	$= 4.448\,221\,615\,2605 \text{ N}$
poundal	pdl	$\equiv 1 \text{ lb}\cdot\text{ft/s}^2$	$= 0.138\,254\,954\,376 \text{ N}$
sthene (mts unit)	sn	$\equiv 1 \text{ t}\cdot\text{m/s}^2$	$= 1 \times 10^3 \text{ N}$
ton-force	tnf	$\equiv g \times 1 \text{ sh tn}$	$= 8.896\,443\,230\,521 \times 10^3 \text{ N}$

lusec	lusec	$\equiv 1\text{ L}\cdot\mu\text{mHg/s}$ ^[14]	$\approx 1.333 \times 10^{-4}\text{ W}$
poncelet	p	$\equiv 100\text{ m kgf/s}$	$= 980.665\text{ W}$
square foot equivalent direct radiation	sq ft EDR	$\equiv 240\text{ BTU}_{\text{IT}}/\text{h}$	$\approx 70.337\,057\text{ W}$
ton of air conditioning		$\equiv 1\text{ t ice melted} / 24\text{ h}$	$\approx 3\,504\text{ W}$
ton of refrigeration (Imperial)		$\equiv 1\text{ BTU}_{\text{IT}} \times 1\text{ lng tn/lb} \div 10\text{ min/s}$	$\approx 3.938\,875 \times 10^3\text{ W}$
ton of refrigeration (IT)		$\equiv 1\text{ BTU}_{\text{IT}} \times 1\text{ sh tn/lb} \div 10\text{ min/s}$	$\approx 3.516\,853 \times 10^3\text{ W}$
watt (SI unit)	W	The power which in one second of time gives rise to one joule of energy. ^[24]	$= 1\text{ W} = 1\text{ J/s} = 1\text{ N}\cdot\text{m/s} = 1\text{ kg}\cdot\text{m}^2/\text{s}^3$

Action

Action			
Name of unit	Symbol	Definition	Relation to SI units
atomic unit of action	au	$\equiv \hbar \equiv h/2\pi$	$\approx 1.054\,571\,68 \times 10^{-34}\text{ J}\cdot\text{s}$ ^[27]

Dynamic viscosity

Dynamic viscosity			
Name of unit	Symbol	Definition	Relation to SI units
pascal second (SI unit)	Pa·s	$\equiv \text{N}\cdot\text{s}/\text{m}^2, \text{ kg}/(\text{m}\cdot\text{s})$	$= 1\text{ Pa}\cdot\text{s}$
poise (cgs unit)	P	$\equiv 10^{-1}\text{ Pa}\cdot\text{s}$	$= 0.1\text{ Pa}\cdot\text{s}$
pound per foot hour	lb/(ft·h)	$\equiv 1\text{ lb}/(\text{ft}\cdot\text{h})$	$\approx 4.133\,789 \times 10^{-4}\text{ Pa}\cdot\text{s}$
pound per foot second	lb/(ft·s)	$\equiv 1\text{ lb}/(\text{ft}\cdot\text{s})$	$\approx 1.488\,164\text{ Pa}\cdot\text{s}$
pound-force second per square foot	lbf·s/ft²	$\equiv 1\text{ lbf}\cdot\text{s}/\text{ft}^2$	$\approx 47.880\,26\text{ Pa}\cdot\text{s}$
pound-force second per square inch	lbf·s/in²	$\equiv 1\text{ lbf}\cdot\text{s}/\text{in}^2$	$\approx 6,894.757\text{ Pa}\cdot\text{s}$

Kinematic viscosity

Kinematic viscosity

Name of unit	Symbol	Definition	Relation to SI units
square foot per second	ft ² /s	$\equiv 1 \text{ ft}^2/\text{s}$	$= 0.092\,903\,04 \text{ m}^2/\text{s}$
square metre per second (SI unit)	m ² /s	$\equiv 1 \text{ m}^2/\text{s}$	$= 1 \text{ m}^2/\text{s}$
stokes (cgs unit)	St	$\equiv 10^{-4} \text{ m}^2/\text{s}$	$= 10^{-4} \text{ m}^2/\text{s}$

Electric current

Electric current

Name of unit	Symbol	Definition	Relation to SI units
ampere (SI base unit)	A	\equiv The constant current needed to produce a force of 2×10^{-7} newton per metre between two straight parallel conductors of infinite length and negligible circular cross-section placed one metre apart in a vacuum. ^[8]	$= 1 \text{ A}$
electromagnetic unit; abampere (cgs unit)	abamp	$\equiv 10 \text{ A}$	$= 10 \text{ A}$
esu per second; statampere (cgs unit)	esu/s	$\equiv (0.1 \text{ A}\cdot\text{m/s}) / c$	$\approx 3.335\,641 \times 10^{-10} \text{ A}$

Electric charge

Electric charge

Name of unit	Symbol	Definition	Relation to SI units
abcoulomb; electromagnetic unit (cgs unit)	abC; emu	$\equiv 10 \text{ C}$	$= 10 \text{ C}$
atomic unit of charge	au	$\equiv e$	$\approx 1.602\,176\,462 \times 10^{-19} \text{ C}$
coulomb (SI unit)	C	\equiv The amount of electricity carried in one second of time by one ampere of current. ^[24]	$= 1 \text{ C} = 1 \text{ A}\cdot\text{s}$
faraday	F	$\equiv 1 \text{ mol} \times N_A \cdot e$	$\approx 96\,485.3383 \text{ C}$
statcoulomb; franklin; electrostatic unit (cgs unit)	statC; Fr; esu	$\equiv (0.1 \text{ A}\cdot\text{m}) / c$	$\approx 3.335\,641 \times 10^{-10} \text{ C}$

Electric dipole

Electric dipole

Name of unit	Symbol	Definition	Relation to SI units
atomic unit of electric dipole moment	ea_0		$\approx 8.478\,352\,81 \times 10^{-30} \text{ C}\cdot\text{m}^{[28]}$

Electromotive force, electric potential difference**Voltage, electromotive force**

Name of unit	Symbol	Definition	Relation to SI units
abvolt (cgs unit)	abV	$\equiv 1 \times 10^{-8} \text{ V}$	$= 1 \times 10^{-8} \text{ V}$
statvolt (cgs unit)	statV	$\equiv c \cdot (1 \text{ }\mu\text{J/A}\cdot\text{m})$	$= 299.792\,458 \text{ V}$
volt (SI unit)	V	The difference in electric potential across two points along a conducting wire carrying one ampere of constant current when the power dissipated between the points equals one watt. ^[24]	$= 1 \text{ V} = 1 \text{ W/A} = 1 \text{ kg}\cdot\text{m}^2/(\text{A}\cdot\text{s}^3)$

Electrical resistance**Electrical resistance**

Name of unit	Symbol	Definition	Relation to SI units
ohm (SI unit)	Ω	The resistance between two points in a conductor when one volt of electric potential difference, applied to these points, produces one ampere of current in the conductor. ^[24]	$= 1 \text{ }\Omega = 1 \text{ V/A} = 1 \text{ kg}\cdot\text{m}^2/(\text{A}^2\cdot\text{s}^3)$

Capacitance**Capacitor's ability to store charge**

Name of unit	Symbol	Definition	Relation to SI units
farad (SI unit)	F	The capacitance between two parallel plates that results in one volt of potential difference when charged by one coulomb of electricity. ^[24]	$= 1 \text{ F} = 1 \text{ C/V} = 1 \text{ A}^2\cdot\text{s}^4/(\text{kg}\cdot\text{m}^2)$

Magnetic flux**magnetic flux**

Name of unit	Symbol	Definition	Relation to SI units
maxwell (CGS unit)	Mx	$\equiv 10^{-8} \text{ Wb}^{[29]}$	$= 1 \times 10^{-8} \text{ Wb}$

weber (SI unit)	Wb	Magnetic flux which, linking a circuit of one turn, would produce in it an electromotive force of 1 volt if it were reduced to zero at a uniform rate in 1 second. ^[24]	$= 1 \text{ Wb} = 1 \text{ V}\cdot\text{s} = 1 \text{ kg}\cdot\text{m}^2/(\text{A}\cdot\text{s}^2)$
-----------------	----	--	---

Magnetic flux density

What physicists call Magnetic field is called Magnetic flux density by electrical engineers and magnetic induction by applied mathematicians and electrical engineers.

Name of unit	Symbol	Definition	Relation to SI units
gauss (CGS unit)	G	$\equiv \text{Mx}/\text{cm}^2 = 10^{-4} \text{ T}$	$= 1 \times 10^{-4} \text{ T}$ ^[30]
tesla (SI unit)	T	$\equiv \text{Wb}/\text{m}^2$	$= 1 \text{ T} = 1 \text{ Wb}/\text{m}^2 = 1 \text{ kg}/(\text{A}\cdot\text{s}^2)$

Inductance

Inductance

Name of unit	Symbol	Definition	Relation to SI units
henry (SI unit)	H	The inductance of a closed circuit that produces one volt of electromotive force when the current in the circuit varies at a uniform rate of one ampere per second. ^[24]	$= 1 \text{ H} = 1 \text{ Wb}/\text{A} = 1 \text{ kg}\cdot\text{m}^2/(\text{A}\cdot\text{s}^2)$

Temperature

For more details on this topic, see Temperature conversion.

Temperature

Name of unit	Symbol	Definition	Conversion to kelvin
degree Celsius	°C	$^{\circ}\text{C} \equiv \text{K} - 273.15$	$[\text{K}] \equiv [^{\circ}\text{C}] + 273.15$
degree Delisle	°De		$[\text{K}] = 373.15 - [^{\circ}\text{De}] \times 2/3$
degree Fahrenheit	°F	$^{\circ}\text{F} \equiv ^{\circ}\text{C} \times 9/5 + 32$	$[\text{K}] \equiv ([^{\circ}\text{F}] + 459.67) \times 5/9$
degree Newton	°N		$[\text{K}] = [^{\circ}\text{N}] \times 100/33 + 273.15$
degree Rankine	°R; °Ra	$^{\circ}\text{R} \equiv \text{K} \times 9/5$	$[\text{K}] \equiv [^{\circ}\text{R}] \times 5/9$
degree Réaumur	°Ré		$[\text{K}] = [^{\circ}\text{Ré}] \times 5/4 + 273.15$
degree Rømer	°Rø		$[\text{K}] = ([^{\circ}\text{Rø}] - 7.5) \times 40/21 + 273.15$
kelvin (SI base unit)	K	$\equiv 1/273.16$ of the thermodynamic temperature of the triple point of water. ^[8]	$\equiv 1 \text{ K}$

Information entropy

Information entropy				
Name of unit	Symbol	Definition	Relation to SI units	Relation to bits
SI unit	J/K	\equiv J/K	$=$ 1 J/K	
nat; nip; nepit	nat	$\equiv k_B$	$= 1.380\,650\,5(23) \times 10^{-23}$ J/K	
bit; shannon	bit; b; Sh	$\equiv \ln(2) \times k_B$	$= 9.569\,940\,(16) \times 10^{-24}$ J/K	$=$ 1 bit
ban; hartley	ban; Hart	$\equiv \ln(10) \times k_B$	$= 3.179\,065\,3(53) \times 10^{-23}$ J/K	
nibble		\equiv 4 bits	$= 3.827\,976\,0(64) \times 10^{-23}$ J/K	$= 2^2$ bit
byte	B	\equiv 8 bits	$= 7.655\,952\,(13) \times 10^{-23}$ J/K	$= 2^3$ bit
kilobyte (decimal)	kB	\equiv 1 000 B	$= 7.655\,952\,(13) \times 10^{-20}$ J/K	
kilobyte (kibibyte)	KB; KiB	\equiv 1 024 B	$= 7.839\,695\,(13) \times 10^{-20}$ J/K	$= 2^{10}$ bit

Often, information entropy is measured in shannons, whereas the (discrete) storage space of digital devices is measured in bits. Thus, uncompressed redundant data occupy more than one bit of storage per shannon of information entropy. The multiples of a bit listed above are usually used with this meaning. Other times the bit is used as a measure of information entropy and is thus a synonym of shannon.

Luminous intensity

The candela is the preferred nomenclature for the SI unit.

Luminous intensity			
Name of unit	Symbol	Definition	Relation to SI units
candela (SI base unit); candle	cd	The luminous intensity, in a given direction, of a source that emits monochromatic radiation of frequency 540×10^{12} hertz and that has a radiant intensity in that direction of 1/683 watt per steradian. ^[8]	$=$ 1 cd
candlepower (new)	cp	\equiv cd The use of <i>candlepower</i> as a unit is discouraged due to its ambiguity.	$=$ 1 cd
candlepower (old, pre-1948)	cp	Varies and is poorly reproducible. ^[31] Approximately 0.981 cd. ^[14]	\approx 0.981 cd

Luminance

Luminance			
Name of unit	Symbol	Definition	Relation to SI units
candela per square foot	cd/ft ²	\equiv cd/ft ²	\approx 10.763 910 417 cd/m ²
candela per square inch	cd/in ²	\equiv cd/in ²	\approx 1,550.0031 cd/m ²

candela per square metre (SI unit); nit (deprecated [14])	cd/m ²	≡ cd/m ²	= 1 cd/m ²
footlambert	fL	≡ (1/π) cd/ft ²	≈ 3.426 259 0996 cd/m ²
lambert	L	≡ (10 ⁴ /π) cd/m ²	≈ 3,183.098 8618 cd/m ²
stilb (CGS unit)	sb	≡ 10 ⁴ cd/m ²	≈ 1 × 10 ⁴ cd/m ²

Luminous flux

Luminous flux

Name of unit	Symbol	Definition	Relation to SI units
lumen (SI unit)	lm	≡ cd·sr	= 1 lm = 1 cd·sr

Illuminance

Illuminance

Name of unit	Symbol	Definition	Relation to SI units
footcandle; lumen per square foot	fc	≡ lm/ft ²	= 10.763 910 417 lx
lumen per square inch	lm/in ²	≡ lm/in ²	≈ 1,550.0031 lx
lux (SI unit)	lx	≡ lm/m ²	= 1 lx = 1 lm/m ²
phot (CGS unit)	ph	≡ lm/cm ²	= 1 × 10 ⁴ lx

Radiation - source activity

Radioactivity

Name of unit	Symbol	Definition	Relation to SI units
becquerel (SI unit)	Bq	≡ Number of disintegrations per second	= 1 Bq = 1/s
curie	Ci	≡ 3.7 × 10 ¹⁰ Bq	= 3.7 × 10 ¹⁰ Bq [32]
rutherford (H)	rd	≡ 1 MBq	= 1 × 10 ⁶ Bq

Please note that although becquerel (Bq) and hertz (Hz) both ultimately refer to the same SI base unit (s^{−1}), Hz is used only for periodic phenomena, and Bq is only used for stochastic processes associated with radioactivity.[33]

Radiation - exposure

Radiation - exposure

Name of unit	Symbol	Definition	Relation to SI units

roentgen	R	$1\text{ R} \equiv 2.58 \times 10^{-4}\text{ C/kg}^{[29]} = 2.58 \times 10^{-4}\text{ C/kg}$
----------	---	--

The roentgen is not a SI unit and the NIST strongly discourages its continued use.^[34]

Radiation - absorbed dose

Radiation - absorbed dose			
Name of unit	Symbol	Definition	Relation to SI units
gray (SI unit)	Gy	$\equiv 1\text{ J/kg} = 1\text{ m}^2/\text{s}^2$ ^[35]	$= 1\text{ Gy}$
rad	rad	$\equiv 0.01\text{ Gy}^{[29]}$	$= 0.01\text{ Gy}$

Radiation - equivalent dose

Radiation - equivalent dose			
Name of unit	Symbol	Definition	Relation to SI units
Röntgen equivalent man	rem	$\equiv 0.01\text{ Sv}$	$= 0.01\text{ Sv}$
sievert (SI unit)	Sv	$\equiv 1\text{ J/kg}^{[33]}$	$= 1\text{ Sv}$

Although the definitions for sievert (Sv) and gray (Gy) would seem to indicate that they measure the same quantities, this is not the case. The effect of receiving a certain dose of radiation (given as Gy) is variable and depends on many factors, thus a new unit was needed to denote the biological effectiveness of that dose on the body; this is known as the equivalent dose and is shown in Sv. The general relationship between absorbed dose and equivalent dose can be represented as

$$H = Q \cdot D$$

where *H* is the equivalent dose, *D* is the absorbed dose, and *Q* is a dimensionless quality factor. Thus, for any quantity of *D* measured in Gy, the numerical value for *H* measured in Sv may be different.^[36]

Software tools

Home and office computers come with converters in bundled spreadsheet applications or can access free converters via the Internet. Units and measurements can be easily converted using these tools, but only if the units are explicitly defined and the conversion is compatible (e.g., cmHg to kPa).

General commercial sources of converters

- Advanced electronic calculators have unit-conversion functionality.
- Spreadsheet programs usually provide conversion functions or formulas or the user can write their own.
- Commercial mathematical, scientific and technical applications often include converters.

Bevel gear

From Wikipedia, the free encyclopedia

Bevel gears are gears where the axes of the two shafts intersect and the tooth-bearing faces of the gears themselves are conically shaped. Bevel gears are most often mounted on shafts that are 90 degrees apart, but can be designed to work at other angles as well. The pitch surface of bevel gears is a cone.

Introduction

Two important concepts in gearing are **pitch surface** and **pitch angle**. The pitch surface of a gear is the imaginary toothless surface that you would have by averaging out the peaks and valleys of the individual teeth. The pitch surface of an ordinary gear is the shape of a cylinder. The pitch angle of a gear is the angle between the face of the pitch surface and the axis.

The most familiar kinds of bevel gears have pitch angles of less than 90 degrees and therefore are cone-shaped. This type of bevel gear is called **external** because the gear teeth point outward. The pitch surfaces of meshed external bevel gears are coaxial with the gear shafts; the apexes of the two surfaces are at the point of intersection of the shaft axes.

Bevel gears that have pitch angles of greater than ninety degrees have teeth that point inward and are called **internal** bevel gears.

Bevel gears that have pitch angles of exactly 90 degrees have teeth that point outward parallel with the axis and resemble the points on a crown. That's why this type of bevel gear is called a **crown** gear.

Miter gears are mating bevel gears with equal numbers of teeth and with axes at right angles.

Skew bevel gears are those for which the corresponding crown gear

Bevel gear on roller shutter door.

Independently from the operating angle, the gear axes must intersect (at the point O)

Bevel gear lifts floodgate by means of central screw.

has teeth that are straight and oblique.

Teeth

There are two issues regarding tooth shape. One is the cross-sectional profile of the individual tooth. The other is the line or curve on which the tooth is set on the face of the gear: in other words the line or curve along which the cross-sectional profile is projected to form the actual three-dimensional shape of the tooth. The primary effect of both the cross-sectional profile and the tooth line or curve is on the smoothness of operation of the gears. Some result in a smoother gear action than others.

Tooth line

The teeth on bevel gears can be straight, spiral or "zero".

Straight tooth lines

In **straight bevel gears** the teeth are straight and parallel to the generators of the cone. This is the simplest form of bevel gear. It resembles a spur gear, only conical rather than cylindrical. The gears in the floodgate picture are straight bevel gears. In straight, when each tooth engages it impacts the corresponding tooth and simply curving the gear teeth can solve the problem.

Spiral tooth lines

Main article: spiral bevel gear

Spiral bevel gears have their teeth formed along spiral lines. They are somewhat analogous to cylindrical type helical gears in that the teeth are angled; however with spiral gears the teeth are also curved.

The advantage of the spiral tooth over the straight tooth is that they engage more gradually. The contact between the teeth starts at one end of the gear and then spreads across the whole tooth. This results in a less abrupt transfer of force when a new pair of teeth come in to play. With straight bevel gears, the abrupt tooth engagement causes noise, especially at high speeds, and impact stress on the teeth which makes them unable to take heavy loads at high speeds without breaking. For these reasons straight bevel gears are generally limited to use at linear speeds less than 1000 feet/min; or, for small gears, under 1000 r.p.m.^[1]

Zero tooth lines

Zero bevel gears are an intermediate type between straight and spiral bevel gears. Their teeth are curved, but not angled.

Applications

The bevel gear has many diverse applications such as locomotives, marine applications, automobiles, printing presses, cooling towers, power plants, steel plants, railway track inspection machines, etc.

For examples, see the following articles on:

- Bevel gears are used in **differential drives**, which can transmit power to two axles spinning at different speeds, such as those on a cornering automobile.
- Bevel gears are used as the main mechanism for a **hand drill**. As the handle of the drill is turned in a vertical direction, the bevel gears change the rotation of the chuck to a horizontal rotation. The bevel gears in a hand drill have the added advantage of increasing the speed of rotation of the chuck and this makes it possible to drill a range of materials.
- The gears in a **bevel gear planer** permit minor adjustment during assembly and allow for some displacement due to deflection under operating loads without concentrating the load on the end of the tooth.
- Spiral bevel gears are important components on **rotorcraft** drive systems. These components are required to operate at high speeds, high loads, and for a large number of load cycles. In this application, spiral bevel gears are used to redirect the shaft from the horizontal gas turbine engine to the vertical rotor.

Advantages

- This gear makes it possible to change the operating angle.
- Differing of the number of teeth (effectively diameter) on each wheel allows mechanical advantage to be changed. By increasing or decreasing the ratio of teeth between the drive and driven wheels one may change the ratio of rotations between the two, meaning that the rotational drive and torque of the second wheel can be changed in relation to the first, with speed increasing and torque decreasing, or speed decreasing and torque increasing.

Bevel gears on grain mill at Dordrecht. Note wooden teeth inserts on one of the gears.

Disadvantages

- One wheel of such gear is designed to work with its complementary wheel and no other.
- Must be precisely mounted.
- The axes must be capable of supporting significant forces.
